At Trillium, we concept, write, edit, design, and produce materials that...

help kids think critically...

**Making Power from Water**  
 A dam is a barrier across a river or stream that holds back water. The water behind the dam is used to generate electricity. The water flows through a turbine, which turns a generator to produce electricity.

**A Hydroelectric Dam**

**Flood Control**  
 Floods caused by overflowing rivers can be a disaster. If flood can be only a few inches of water, it can cause a lot of damage. There are other ways to control water in areas where flooding is common. The excess water can be used for irrigation on a small farm, or even for growing flowers. Floods from rivers used to be a big problem in the western United States. Flood control is a big problem in the western United States. Flood control is a big problem in the western United States.
